Froet Drain® roof drain 6" Flow comparison

FROET INDUSTRIES LLC

Our six inch drain's advanced design enables it to substantially outflow all competitive products we have tested. Like Froet's four inch drain, our six inch drain flows at greater rates with less head pressure, in comparison to competitors' products we have tested, which assures the primary system reaches full flow before the overflow system begins to function. As the accompanying graph shows, the small body drain as tested experienced flow over the two inch overflow elevation at about one-fourth the required flow rate. (Our six inch overflow results are measured from the starting point of water flowing into the overflow pipe and not at the low point of the primary strainer). When specifying a roof drain, the magnitude of head at capacity must be known in order to assure proper drainage design. Patent No. US6594966.
